Abstract

- **Unified Emergency Intelligence for Tourists** is a web-based platform that helps tourists access emergency assistance quickly.
- The system provides **emergency service information, safety guidelines, and emergency request submission**.
- Tourists can easily find **hospitals, police stations, and other emergency contacts** through the website.
- The project is developed using **HTML, CSS, and JavaScript** to create an interactive and user-friendly interface.
- It improves **tourist safety and accessibility to emergency services in unfamiliar locations**.

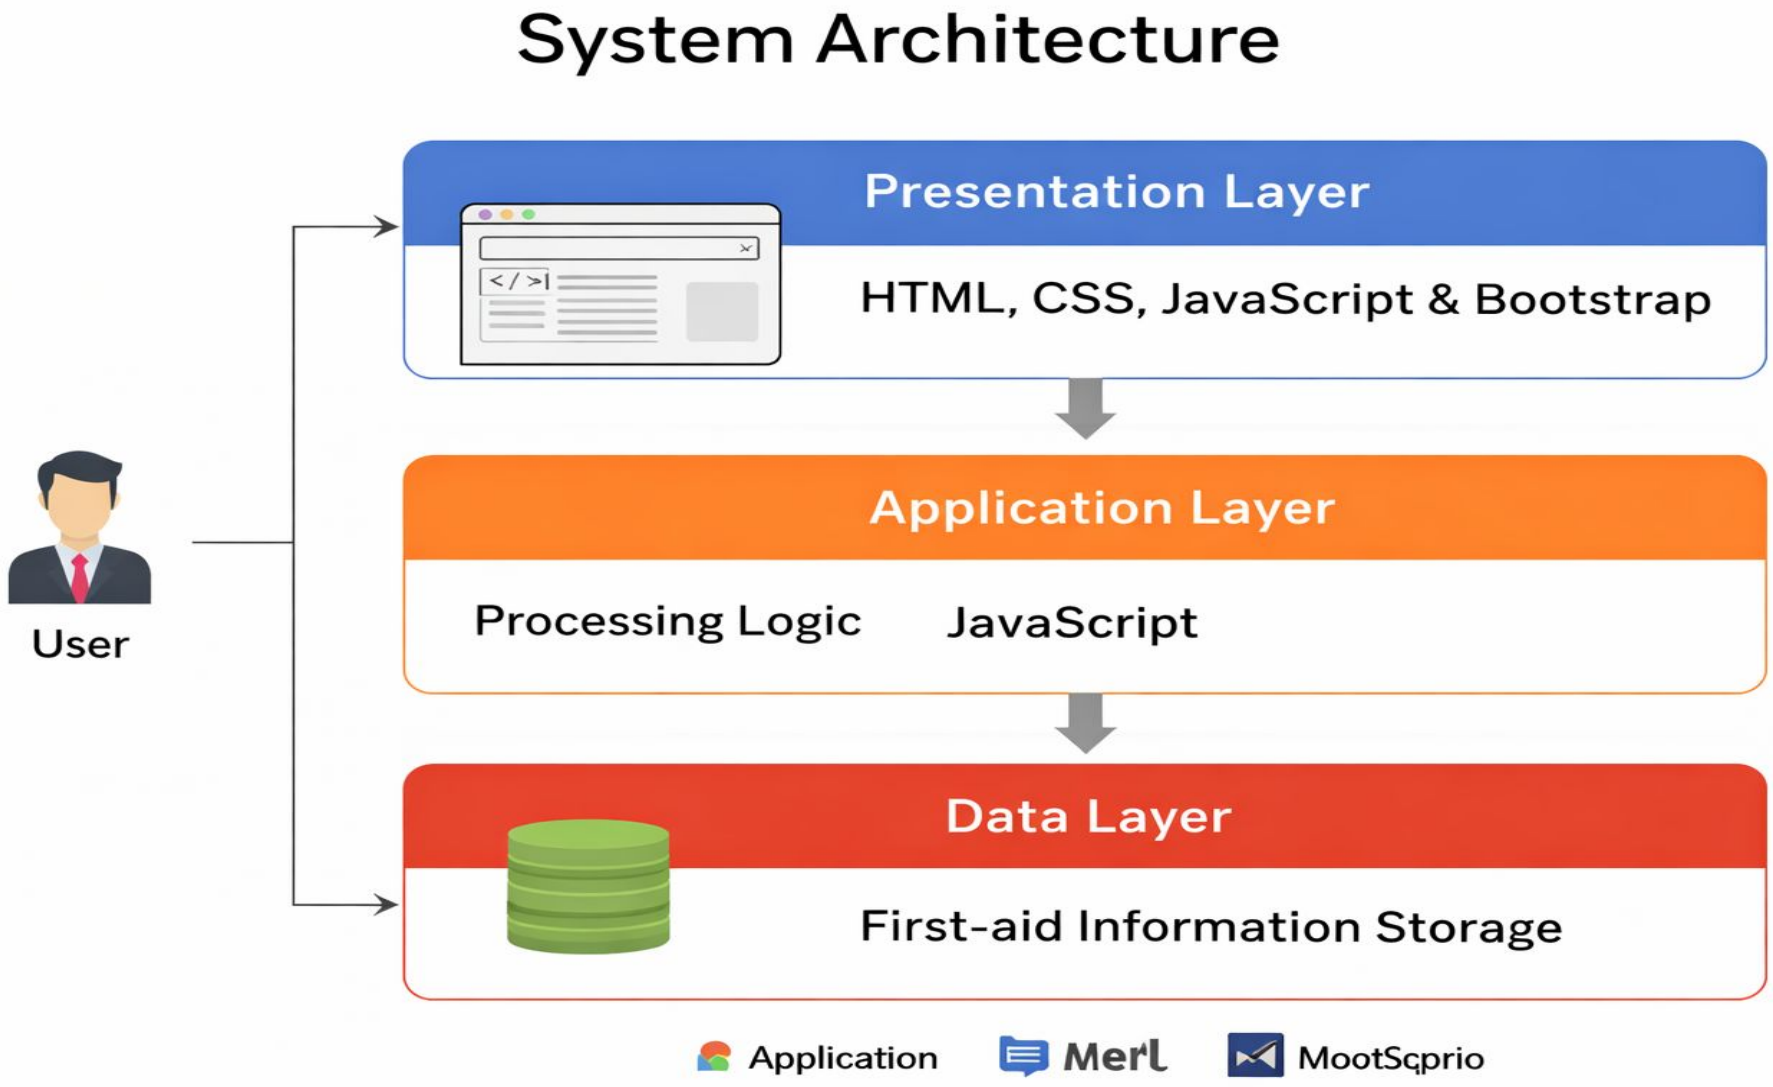
Existing System

- **Tourists** usually depend on **internet searches or local people** to find emergency help.
- Emergency contact information is **scattered across different websites and apps**.
- There is **no single platform** that provides emergency services and safety information together.
- Finding the right emergency service during critical situations can **take time and cause confusion**.

Proposed System

- A **centralized web platform** that provides all emergency services information in one place.
- Tourists can **view emergency contacts and safety information easily**.
- The system includes an **emergency request form** to report incidents quickly.
- Provides a **simple and interactive interface** for easy navigation.
- Includes an **admin dashboard** to monitor emergency requests and manage service details.

System Architecture



Project Modules

- **Home Module** – Displays project introduction and navigation to other pages.
- **Emergency Services Module** – Shows emergency contacts like hospitals and police stations.
- **Emergency Request Module** – Allows tourists to report emergencies using a form.
- **Safety Information Module** – Provides safety tips and guidelines for tourists.
- **Admin Dashboard Module** – Displays and manages emergency requests

Objectives

- To develop a **web-based platform** that helps tourists access emergency services quickly.
- To provide **centralized information** about hospitals, police stations, and other emergency contacts.
- To allow tourists to **report emergencies through an online form**.
- To provide **tourist safety information and guidelines**.
- To create a **user-friendly and responsive interface** using HTML, CSS, and JavaScript.
- To enable **administrators to monitor emergency requests through an admin dashboard**.

Co’s Attainments - FWD

CO1 Outcome Topics	Topics Included in My Project
Internet fundamentals and web concepts HTML document structure Headings and paragraphs Links and navigation Introductory CSS styling CSS syntax and selectors Typography essentials Color representation in CSS Spacing using padding, margin, and border	• Developed structured HTML web pages for the emergency intelligence system • Used headings and paragraphs to present emergency and safety information • Implemented navigation links between pages like dashboard, emergency, safety, and admin • Applied CSS styling to design the user interface • Used CSS selectors to style different page components • Implemented typography styling for titles and text readability • Used color styling to highlight important information and alerts • Applied spacing (margin, padding, borders) to organize layout and containers

Co’s Attainments - FWD

CO2 Outcome Topics	Topics Included in My Project
Internet fundamentals and web concepts HTML document structure Headings and paragraphs Links and navigation Introductory CSS styling CSS syntax and selectors Typography essentials Color representation in CSS Spacing using padding, margin, and border	• HTML forms for submitting emergency requests • Form input elements such as text fields and text areas • Basic form attributes for collecting user data • Semantic HTML structure using sections and containers • Meta tags for page structure and browser compatibility • Typography styling using CSS for headings and text • Flexbox layout for arranging page sections • Block layout using div containers for page structure • Responsive layout adjustments using CSS • Basic styling for interactive UI elements like buttons and forms

Co’s Attainments - FWD

CO3 Outcome Topics	Topics Included in My Project
JavaScript basic expressions and operators Conditional statements Loops Functions Arrow functions Callback functions Objects Object inheritance Arrays Array methods Number literals	• JavaScript conditional statements to control program logic • Functions for handling user actions and page behavior • Basic JavaScript expressions and operators for processing inputs • Arrays for storing emergency request data • Objects to represent structured emergency information • Basic loops to process and display data dynamically •

Co’s Attainments - FWD

CO4 Outcome Topics	Topics Included in My Project
DOM manipulation Event handling Storage and asynchronous programming Browser storage Promises	• DOM manipulation to update page content dynamically • Event handling for buttons and form submissions • Interactive user interface behavior using JavaScript events • Dynamic data display in the dashboard interface

Co’s Attainments - FWD

CO5 Outcome Topics	Topics Included in My Project
Exception handling ES6 modules Form validation with JavaScript Handling user input dynamically API integration Optimize page load times Meta tags for SEO-friendly pages CORS understanding Deploying the project	• Handling user input dynamically using JavaScript Basic form validation for emergency request submission • Meta tags included in HTML pages • Organized project structure for web application deployment • Optimized page structure for better performance

Co’s Attainments - DSA

CO1 Outcome Topics	Topics Included in My Project
Actual CO1 Outcome Topics ● Algorithmic efficiency and asymptotic notation ● Classical searching algorithms ● Classical sorting algorithms	**Linear Search algorithm** for searching services by location **HashMap search** for fast service lookup (O(1) average complexity) **Bubble Sort algorithm** for sorting emergency services **Basic reasoning of algorithm efficiency** for searching and sorting operations

Co's Attainments - DSA

CO2 Outcome Topics	Topics Included in My Project
• **Abstract Data Types (ADTs) using arrays and linked lists** • **Operations such as insert, delete, search, traverse**	**ArrayList used as an ADT** to store emergency services **Insert operation** using services.add() **Search operation** using list traversal and HashMap lookup **Traversal operation** using loops to display services

CO3 Outcome Topics	Topics Included in My Project
• **Stacks** • **Queues** • **Priority queues**	**Stack data structure to store user search history** **PriorityQueue data structure to manage emergency requests based on severity** **Queue operations such as adding and processing emergency requests**

Co’s Attainments - DSA

CO4 Outcome Topics	Topics Included in My Project
• Hash-based data structures • Java Collections (List, Queue, Deque, Map)	HashMap for fast emergency service lookup ArrayList (List collection) for storing services PriorityQueue (Queue collection) for emergency prioritization Stack collection for maintaining search history

CO5 Outcome Topics	Topics Included in My Project
• Practical applications of linear data structures	• Tourist Emergency Intelligence System implemented as a practical application • Real-world simulation of emergency service management using data structures

Conclusion

The **Unified Emergency Intelligence for Tourists** provides a simple platform for tourists to access emergency services quickly.

It allows users to **view emergency contacts, report emergencies, and access safety information** in one place.

The system improves **tourist safety and accessibility to emergency assistance** in unfamiliar locations.

Developed using **HTML, CSS, and JavaScript**, the platform offers an interactive and user-friendly interface.

Overall, the project helps make **travel safer and more convenient for tourists**.
